

The Johnson & Johnson corporate Credo, Paragraph 4
“Research must be carried on, innovative programs
developed and mistakes paid for.”

Before Stelara.

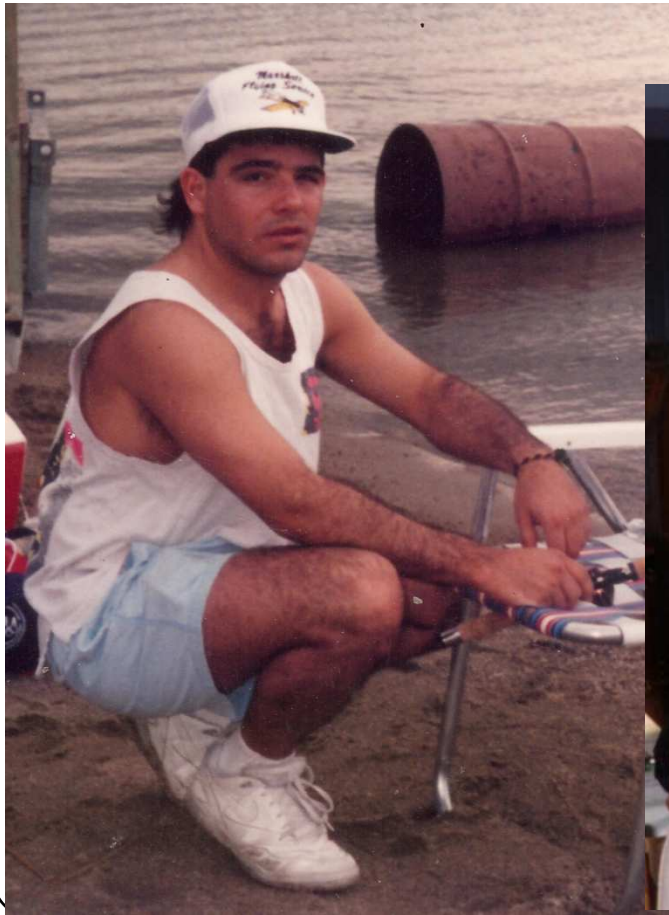

- Everything in this presentation is true and backed up with medical records, letters, e-mails, video tape and photographs.

3 Months After Stelara.

This is TONY. He's a great guy.

- Born November 13, 1967, California, USA.
- Professionally successful in all endeavors.
- Active with: Family, Friends, Work, Church, Volunteering, Education, Recreation, Hobbies, Sports leagues and Pets.
- Professionally and socially active and responsible.

In 1999, Tony developed psoriasis

- mostly on his knees and elbows, with, a little here and there. (Occasional quarter sized spots on his leg, thigh or hand, shown above) But never more than 10%-12% coverage.
- Tony's psoriasis was identical to his father's psoriasis.
- His father, now retired, has 10-12% coverage plaque psoriasis as he had at age 35. His dad gets good relief from UV treatments but has never taken biologics. His psoriasis has remained steady for over 30 years.
- **From 1999 to 2007, Tony's psoriasis never changed.**
- In 2007, Tony enters a clinical trial for a new psoriasis medication, that he was told showed equal promise for arthritis, Tony's real problem. **He was in the trial for nearly one year.**
- The pictures above are from just before he began Stelara, Johnson & Johnson's now \$1.4 Billion/year drug.
- During the year of the trial, his skin cleared completely. But there is no change in his arthritis.

March - April 2008, Tony breaks out in small dots on his entire body

- In February of 2008, weeks after his last dose of Stelara, Tony's skin began to tingle and burn.
- In March, his skin starts breaking out with hundreds of small lesions. Tony calls the trial to get involved. No Reply
- From March to April, lesions grew and spread over his whole body. Tony kept calling for information and help.
- By May 1st Tony has called the trial company over 10 times and sent 4 letters with pictures and medical reports, but received no replies. Tony files his first online FDA "adverse reaction report".
- The small lesions grow together to cover whole areas of his body. He is hospitalized for the first time.

May to June, the dots grow and spread

- By June 1st Tony can no longer walk. His has blood levels of a severe burn victim. He is put on antibiotics and is hospitalized at Riverside County Medical Center for 7 days.
- We begged the trial company and the drug's makers for help. But the companies are not talking.... Johnson & Johnson, A family company.
- By June 15th, Tony has **external Guttate, Pustular and Inverse Psoriasis** with genital, oral, anal and other **internal** lesions. 4 distinct kinds of non-plaque psoriasis, but also has changing plaques like doctors have never seen.
- Riverside County Doctors transfer Tony to UCSD Medical Center for "Burn Unit" treatment as he borders on systemic shock. To attempt a start at healing, nurses scrub the remaining plaques from his body and over 200 psoriasis lesions from his back alone.

June - July, 2008

July – Aug 2008

With 90% of his body having phased through every type of psoriasis, full burn trauma techniques are required to stem his shock. Nurses initially squeeze IV bags of fluid into his veins to stem his dehydration. With his skin now gone, Tony must lay 20 hours per day with towels, wet with sterile saline, covering his body to keep his fever down and prevent shock and kidney failure.

These same pictures were originally taken and sent to the trial company and the government in an attempt to show the severity of this “adverse event” and to get them to act. They never did.

AND IT NEVER WENT AWAY. Tony at age 42, 43 and 44

In 2010 -Tony developed a grapefruit sized mass in his right leg. It has been diagnosed as "An overgrowth of the leg muscle. Muscle tissue replacement due to "healing" is growing on his normal muscle" The same process that the skin undergoes in Psoriasis, but internally on muscle.

- In 2011 An unclassified immune reaction has killed the roots of Anthony's teeth necessitating the removal of nearly all his teeth. never seen before by his dentist with 30 years experience.
- In 2012 Tony developed a spot in his upper right lung. It is being monitored. Cause unknown.
- In 2012 The repeated loss of ¼" thick slabs of skin from the soles of his feet have caused permanent nerve damage manifested as level 9 burning, shooting pain through his feet, even during the brief periods when his feet "look" more normal, which has been only 75 days in the past year.

2013 - Searing pain in the most sensitive areas of the human body

It is late 2013. Tony is in bed. He has been bed bound for much of the past 4 years. He cannot take the pain of standing on his feet. But he cannot sit on his butt for very long either. He is dogged by continuous fungal and other infections. He is in so much pain, that he just wants to die at this point. Why? Because the American Corporate, Medical, Legislative and Justice systems show no sign of caring, responsibility or compassion that might lead to any action or hope for a treatment or some relief from the pain. Any shred of dignity.

• Tony's back, today. What is special about this picture? These newly formed small red dots that now cover his entire back are precisely how the worst breakout that nearly killed him began. You can see the dots on the upper and left side already growing. His upper back has been the only part of his body spared from permanent, full time peeling. The last time we saw these dots on his back, was the 2008 prelude to an outbreak that put him into the hospital burn unit.

Same leg, same month

What we know

- Whether Anthony's reaction was a “one-in-a-million” occurrence, was caused due to drug factors that have been corrected, or whether Stelara remains a flawed compound, it makes no difference. This man must receive immediate information and proper, guided medical research and treatment... This suffering is unconscionable. But Information or assistance has been refused by all involved.
- Despite several requests, for the clinical trial data that was promised to be shared, no data was ever shared. J&J has a huge amount of data that could potentially save Tony's life, sitting somewhere,. Tony's unique, personal clinical data from the trial has also been unavailable to us. He cannot ever consider pursuing further medications without understanding the nature of the reaction to the last biologic (Stelara) that he took. Another immune response would kill him.
- We know that resources are put aside during every drug trial, used to treat and compensate those adversely effected by the drug being developed.
- Some people have asked, “why did you wait so long to act?”. We did not wait. We have been fighting the whole time. With “Therapeutics:, Centacor, Medi-CAL, Jonson & Johnson, United Healthcare and other Insurance companies, US Senate staffers. It is only recently that we brought the issue to the people. The American people, who know down inside that they are just one decision away from sharing Tony's fate.

Left leg, 1 month before and 4 months after Stelara

The losses to Anthony due to Stelara:

- Permanent Disability.
- Skin reactions in the 3rd degree burn category.
- Loss of most inter-personal relationships of any kind.
- Permanent disfigurement due to scarring and pigment destruction on his entire body.
- Nerve damage over large areas of Anthony's body due to continued skin destruction and replacement.
- Internal psoriasis in ears, ear canals, ear drums, nose, septum and sinuses, anus and colon that were never there before.
- Chronic outbreaks and lesions in the most sensitive areas of his body. IE genitals, groin, buttocks....
- Psoriasis on the soles of his feet making standing and walking impossible, on 90% of his butt, making sitting impossible and all over his legs and back, making laying impossible. So what options are there...for walking...for sitting...for laying....for sleeping?
- Extreme Nerve damage involving the soles of Anthony's feet, due to continued skin destruction down to the muscle.
- Loss of all teeth due to unknown death of nerves and roots. (Tony only had one cavity in his life up to age 37) Unknown extreme nerve damage involving mouth/ and gums.
- Public revulsion and shunning/persecution and discrimination.
- And Pain - Non-stop, never-ending.

2013

•HELPFORTONY by www.helpfortony.org

In Britain, when a patient in a clinical trial held by Janssen pharmaceutical has an adverse event, Janssen immediately and voluntarily covers all of the patient's medical and personal needs.

They start a no nonsense investigation as to whether the event was caused by the clinical trial. The investigation hinges on one main question. Did the patient have the symptoms of the adverse event prior to starting the trial? If the answer is no, then in most cases, the investigation is over.

If the adverse event proves serious and long lasting, insurance automatically provides compensation. Period.

In the U.S.; when a patient in a clinical trial held by Janssen pharmaceutical has an adverse event, Janssen is under no obligation to even provide the patient with information about the drug that ruined their life, let alone provide compensation or medical expertise.

If the patient needs any sort of information, they must file a report with the FDA, wait up to six months, then file another report with Janssen and wait for the information.

- If the patient needs any sort of compensation due to medical costs or any other reason, their only recourse is ask the FDA to start an investigation. The patient must wait 180 days for an investigation to begin.

- If the FDA chooses to investigate, the patient must then prove somehow that the drug was the cause of the event.

If somehow they do prove that the drug caused the event, it is 100% upon the sick or dying patient to source an attorney, convince them of the financial viability of a law suit, then wait as up to seven years to see if the suit is successfully litigated or settled.

Why the huge difference in how the same situation is handled in 2 countries who are considered "sister" countries?

In Britain, the [\(BHBIA\)](#), British version of the [AMA](#) (American Medical Association) worked with elected representatives and the industry itself, and simply **asked** Janssen and all other industry leaders to sign a completely voluntary set of [guidelines](#).

This [agreement](#) was sponsored by and signed by each [member](#) of the [\(BHBIA\)](#), including [Janssen Pharmaceutical](#), which makes [Stelara](#).

In the U.S. Neither the AMA nor any elected government representative has, or will ask for the same dignity and safety for it's citizen patients as is universally done not only in Britain, but in most other countries of the world.

In particular, we are calling attention to an [adverse event](#) that occurred in 2008 during a clinical trial of Janssen's now \$1.4 Billion blockbuster drug Stelara

We asked all the companies involved in the trial, our FDA and our elected representatives to follow the same procedures for Tony as they voluntarily follow in Britain for all clinical trials. We asked for the same treatment and attention. To absolutely no avail.

- We Asked for the medical records and research information specific to Anthony's **Stelara** Clinical trial **as was promised in the clinical trial**, in order to investigate whether there is any possible way to mediate or undo the damage and changes made by **Stelara** to Anthony's immune system.
- **THEY IGNORE US TO THIS DAY.**
- We asked that Anthony be financially compensated to the degree:
- That he be able to finance independent tests and investigations separate from any other entity in order to map and establish the EXACT state of his immune system from a guaranteed objective source.
- That he be able to fund travel outside the United States to countries that have more advanced treatments than are possible in the US, and cost 1/10th as much.
- That he be able to live with some dignity.

Please visit www.helpfortony.org

Send a message to your **US Senator** at www.senate.gov or to our selected senators, **Dianne Feinstein of California**, and Brian Schatz of Hawaii demanding help for Tony and accountability from Centacor, Janssen and Johnson & Johnson. Tony's life depends on it. Right Now.
